

Project Synopsis

Seekers.com: Smart Job Portal and Mock Interview Platform

RUSHIKESH MANMATH SWAMI

MCA SECOND YEAR

Roll No: 24112032

Abstract

Seekers.com is a modern job portal that helps students and fresh graduates connect with relevant job opportunities and prepare effectively for interviews. The platform allows students to register, add their skills, and be matched to job openings using keyword-based filters. In addition to this core job search feature, Seekers.com offers a premium mock interview system. Students can book practice interviews with real working professionals, receive feedback, and improve their performance. The platform bridges the gap between talent and opportunity through intelligent matching and practical preparation.

Objectives

1. To build a student-focused job portal that matches users to jobs using skill-based filtering.
2. To allow recruiters and companies to post job openings and view matched candidates.
3. To create a paid mock interview booking system with real professionals.
4. To enable working professionals to conduct interviews and earn side income.
5. To provide an admin dashboard for platform-wide monitoring and analytics.

Problem Statement

Students often face two key challenges: difficulty finding relevant job openings and a lack of real-world interview experience. Seekers.com addresses both by offering a job-matching system and a platform for paid mock interviews conducted by industry professionals. This integrated solution helps users prepare and perform better in real placement or job interviews.

Proposed System

The proposed system includes:

- A student dashboard for creating profiles, uploading resumes, and tracking applications.
- A company portal to post jobs and filter candidates based on skills and qualifications.
- A mock interview module where students book sessions with real professionals.
- Payment integration for paid services using Razorpay or Stripe.
- Admin dashboard to manage users, data, and platform analytics.

Technology Stack

- **Frontend:** HTML, CSS, JavaScript
- **Backend:** Python, Django Framework
- **Database:** PostgreSQL / MySQL / SQLite
- **Payment Gateway:** Razorpay API
- **Version Control:** Git, GitHub

System Architecture

Modules

1. **Student Module** – Profile creation, skill tagging, resume upload, job applications, and mock interview booking.
2. **Company Module** – Post job openings, view and shortlist matching student profiles.
3. **Interviewer Module** – Register, set availability, conduct mock interviews, and earn income.
4. **Admin Module** – Manage users, monitor transactions, and view analytics reports.

Expected Outcomes

- A working web application accessible to students, companies, and professionals.
- A skill-based job matching system to increase job relevance.
- A booking system for mock interviews with integrated payments.
- A scalable platform that offers value to students, professionals, and recruiters.

Future Enhancements

- AI-based resume parsing and automated scoring.
- Chatbot assistant for career queries and preparation tips.
- Mobile application version for Android and iOS.
- Integration of peer group discussions or community forums.

1 Aspects Covered by Most Research Papers

The majority of research papers in the domain of online recruitment and job portals have already addressed the following key areas:

1. **Basic Job Posting and Resume Upload Features:** Most portals facilitate uploading resumes and posting job descriptions, which are commonly discussed in academic and industrial research.
2. **General Matching Algorithms:** Several studies have explored candidate-job matching based on broad keyword similarity and classification techniques.
3. **Recruitment Challenges:** Research often highlights industry challenges such as candidate drop-off rates, job market mismatch, and skill gaps.
4. **Security and Privacy Concerns:** Various works have addressed data privacy, protection of candidate profiles, and secure job posting mechanisms.

2 AREA UNDER SEEKERS.COM WILL WORK

While several research papers have explored the trends and challenges in the domain of online recruitment, there are key aspects that remain underexplored. **Seekers.com** aims to fill the following research and implementation gaps:

1. **Automated Keyword-Based Matching:** Most studies do not implement or evaluate real-time matching algorithms based on student skills and job requirement keywords.
2. **Practice Interview Marketplace:** There is no significant research on building a dual-sided platform where professionals can conduct mock interviews for students in exchange for payment.
3. **Student-Centric Design:** Research lacks focus on the student experience, such as profile building, resume validation, and personalized dashboards.
4. **Full-Stack Functional Architecture:** While theoretical models are discussed, there is minimal implementation of a fully integrated web application with frontend, backend, and database layers.

Conclusion

Seekers.com is designed to be a unified platform that simplifies job discovery and enhances interview readiness for students. By offering job matching and a mock interview marketplace in one place, the platform ensures students are not only connected with the right opportunities but also well-prepared to seize them.
